

StretchTRAK™

Fabric covered Acoustical Walls and Ceilings

Reduce reverberation and improve sound quality beautifully using Kinetics' StretchTRAK. The StretchTRAK system improves upon normal limited sized acoustical panels by allowing various absorptive or diffusive cores to be concealed by large, often seamless, runs of acoustical fabric. Whether selecting a white fabric that appears to be normal drywall, or a colorful, impactful fabric, almost any look can be created.

The result is a beautifully upholstered wall or ceiling that is crafted to fit within tight tolerances while providing superior acoustic comfort.

Create crisp corners or even curved edges

Starcoustix SX: Exceptional acoustical performance beneath glowing fiber optic stars

Installation

1. Install Track

The polymer track is flexible to form fit as required around walls, ceilings, doorframes or millwork.

2. Mount Acoustical Core

Select from multiple absorptive and diffusive cores to treat the specific acoustic requirements of the room.

3. Install Fabric

Fabric is tensioned and tucked into the track creating clean, smooth lines and a precise fit
